

Update as of 1900, June 25, 2023

STATEMENT FROM MRL:

*"Transloading of the sodium hydrosulfide car nearest the river has been completed successfully and the car will be re-railed and moved to a secure location. This process entails moving the contents from one rail car to another rail car or truck. We are aware of reports of globs of asphalt appearing downriver that may be associated with the derailment and we will proactively investigate and sample this material. Water quality sampling is being performed by a contractor on behalf of Montana Rail Link with oversight by Montana DEQ and EPA. Preliminary results do not show petroleum hydrocarbons or sulfur impacts to water quality. Water quality testing will continue until the cleanup is complete and at this time there are no known risks to public drinking water. Sprint and its contractors are on site to repair a damaged fiber line associated with the incident. As of this afternoon, National Transportation Safety Board (NTSB) officials have also arrived onsite to assist in reviewing the incident."*

*We are appreciative of Governor Gianforte and the First Lady's visit to the site this afternoon, along with the messages received from members of Montana's Congressional delegation. Additional equipment, including a large crane, will be brought on-site later this evening to assist with construction and remediation efforts. Site cleanup and remediation will be an extensive process, but we are committed to working closely with all of our local, state, and federal partners to perform all required work in a safe and efficient manner."*
